Project 3 - home exercise
=====

README.pdf - This file.
pipes_redirect.c- this program is extension of two prev exercises.
the program begin with prompt: [return_code] [username]@[hostname] $.
when the user write a command (but "cd") the mini shell
creates a new process and it performs the command
when user press cd + direction at the command line mini shell gets to this path
when user press CTRL+C the mini shell kills the son proces but not the father
when user press exit the program ends.
In addition, this program support I\O redirection as right and left arrows ( < ,
>)
appended arroee ( >> ) to write, read and append to file, and support pipes comma
nd (|)
that is the program takes the output of left side of pipe and get it as input of
right side,
creating processes as it needs.
makefile.sh
compile by:
using the makefile.sh
